Issue Question: Are Genetically Modified Crops healthy and safe to use.

My Claim: Genetically Modified Crops are a safe, more productive, and healthy alternative.

- because there is currently no scientific evidence that supports the idea that GMO crops are bad for human health.
- because GMO crops can produce higher yields and can be more resistant to the environment and pests.
- because GMO crops can be made so that they taste better and are more nutritious.

Opposing Claim: GMO crops cause adverse health effects and pollute the environment.

- because GMO crops cause adverse health effects.
- because GMO crops will leak into the environment and mess with the native flora.
- because not enough studies have been done to determine their safety.
